

Please amend the application as follows:

**Listing of Claims:**

1. (Currently Amended) A trainable transceiver for learning signal characteristics of an RF control signal received from a remote control transmitter used to remotely actuate a device and for subsequently transmitting a modulated RF signal having the learned signal characteristics, the trainable transceiver comprising:

an antenna;

a wideband receiver coupled to the antenna, the wideband receiver configured to receive an RF control signal from the remote control transmitter, ~~the RF control signal including a control code, a set of data characteristics and an RF carrier frequency;~~ and

a control circuit coupled to the wideband receiver, the control circuit having a training mode in which the control circuit is configured to ~~identify and store the control code of the RF control signal, to identify at least one data characteristic from the set of data characteristics, to determine a device type associated with the RF control signal without first determining the frequency of transmission of the received RF control signal;~~

wherein the control circuit is further configured to determine and store a frequency for transmissions of the modulated RF signal from the trainable transceiver based on the determined device type, based on the at least one data characteristic and to determine at least one RF frequency associated with the RF control signal based on the determined device type;

2. (Original) A trainable transceiver according to claim 1, wherein the control circuit is further configured to store the at least one RF frequency.

3. (Currently Amended) A trainable transceiver according to claim 1, wherein the control circuit is further configured to identify and store a control code of the RF control signal without first determining the frequency of transmission of the received RF control signal, and wherein the control code is a fixed control code.

4. (Currently Amended) A trainable transceiver according to claim 1, wherein the control circuit is further configured to identify and store a control code of the RF control signal without first determining the frequency of transmission of the received RF control signal, and wherein the control code is an encrypted rolling code and the control circuit is further configured to identify an encryption algorithm associated with the RF control signal without first determining the frequency of transmission of the received RF control signal, based on the at least one data characteristic.

5. (Currently Amended) A trainable transceiver according to claim 1, wherein the control circuit has an operating mode in which the control circuit is further configured to retrieve the frequency and to generate the subsequent transmissions of the modulated RF signal, control code and the at least one RF frequency and to generate an RF signal including the control code and the RF frequency.

6. (Currently Amended) A trainable transceiver according to claim 5, further including a transmitter coupled to the control circuit and the antenna, the transmitter configured to transmit the modulated RF signal to a remote actuate device.

7. (Previously Presented) A trainable transceiver according to claim 1, wherein the wideband receiver is a tuned wideband receiver.

8. (Currently Amended) A trainable transceiver according to claim 1, wherein the wideband receiver is an untuned wideband receiver, wherein a plurality of RF frequencies are determined based on the device type.

9. (Currently Amended) A trainable transceiver according to claim [[8]]1, wherein the control circuit is configured to filter out the RF carrier frequency prior to determining the device type, wherein the control circuit is configured to generate an RF signal at each of the plurality of RF frequencies.

10. (Currently Amended) A trainable transceiver for learning signal characteristics of an RF control signal received from a remote control transmitter used to remotely actuate a device and for subsequently transmitting a modulated RF signal having the learned signal characteristics, the trainable transceiver comprising:

an antenna;

a wideband receiver coupled to the antenna, the wideband receiver configured to receive an RF control signal from the remote control transmitter without scanning for the RF control signal; ~~the RF control signal including a control code, a set of data characteristics and an RF carrier frequency;~~ and

a control circuit coupled to the wideband receiver and having a training mode configured to filter out the carrier frequency of the RF control signal and to analyze the modulation of the RF control signal to determine a device type associated with the remote control transmitter, and wherein the control circuit is configured to use the device type determination to determine the RF frequency for use in subsequent transmissions by the trainable transceiver in an operational mode, and wherein the determination of the RF frequency occurs without scanning of the receiver. ~~in which the control circuit is configured to identify and store the control code of the RF control signal and having an operating mode in which the control circuit is configured to identify at least one data characteristic from the set of data characteristics, to determine a device type based on the at least one data characteristic and to determine at least one RF frequency associated with the RF control signal based on the determined device type.~~

11. (Currently Amended) A trainable transceiver according to claim 10, wherein the control circuit is further configured to identify and store a control code of the RF control signal, and wherein the control code is a fixed control code.

12. (Currently Amended) A trainable transceiver according to claim 10, wherein the control code is an encrypted rolling code and the control circuit is further configured to identify an encryption algorithm based on the determined device type. ~~at least one data characteristic.~~

13. (Currently Amended) A trainable transceiver according to claim 10, wherein the control circuit is further configured in the operating mode to retrieve ~~[[the]]~~ a control code determined to be associated with the RF control signal and to generate an RF signal including the control code at the determined RF frequency, and the at least one RF frequency.

14. (Original) A trainable transceiver according to claim 13, further including a transmitter coupled to the control circuit and the antenna, the transmitter configured to transmit the RF signal to a remotely actuate device.

15. (Original) A trainable transceiver according to claim 10, wherein the wideband receiver is a tuned wideband receiver.

16. (Currently Amended) A trainable transceiver according to claim 10, wherein the wideband receiver is an untuned wideband receiver, wherein a plurality of RF frequencies are determined based on the device type.

17. (Currently Amended) A trainable transceiver according to claim ~~[[16]]~~ 10, wherein the control circuit is further configured to generate an RF signal at each of ~~[[the]]~~ a plurality of RF frequencies associated with the determined device type.

18. (Currently Amended) A method for training a transceiver to learn a set of signal characteristics of an RF control signal received from a remote control transmitter used to remotely actuate a device, the transceiver having an antenna and a wideband receiver, the method comprising:

initiating a training sequence;

receiving the RF control signal using the wideband receiver;

identifying and storing a control code of the RF control signal;

identifying at least one data characteristic from a set of data characteristics for the RF control signal;

determining a device type associated with the RF control signal without analyzing or determining the frequency of transmission of the received RF control signal; based on the at least one data characteristic; and

determining and storing at least one RF frequency associated with the RF control signal based on the determined device type.

19. (Currently Amended) A method according to claim 18, further comprising storing the at least one RF frequency.

20. (Original) A method according to claim 18, wherein the training sequence is initiated in response to the actuation of a switch.

21. (Original) A method according to claim 18, wherein the training sequence is initiated when a signal is received by the transceiver.

22. (Original) A method according to claim 18, wherein the transceiver is mounted in a vehicle and the training sequence is initiated by a message on a vehicle bus.

23. (Currently Amended) A method according to claim 18, wherein the receiver is a tuned wideband receiver.

24. (Cancelled).

25. (Currently Amended) A trainable transceiver according to claim 1, wherein determining the ~~at least one RF frequency associated with the RF control signal~~ comprises selecting the ~~at least one RF frequency~~ from a pre-stored list of frequencies based on the determined device type.

26. (Currently Amended) A trainable transceiver according to claim 10, wherein determining the ~~at least one RF frequency associated with the RF control signal~~ comprises selecting the ~~at least one RF frequency~~ from a pre-stored list of frequencies based on the determined device type.

27. (Currently Amended) A method according to claim 18, wherein determining the at least one RF frequency comprises selecting the at least one RF frequency from a pre-stored list of frequencies based on the determined device type.

28. (Previously Presented) A method according to claim 18, wherein the device type comprises a manufacturer of the device.

29. (Currently Amended) A method for training a transceiver to learn a set of signal characteristics of an RF control signal, the method comprising:

initiating a training sequence;

receiving an RF control signal from a remote control transmitter used to actuate a device, wherein a wideband receiver coupled to an antenna receives the RF control signal without scanning for the RF control signal;

identifying and storing a control code of the RF control signal;

identifying at least one data characteristics from a set of data characteristics for the RF control signal;

determining a manufacturer of the device from a pre-stored list of manufacturers based on the at least one data characteristic and without scanning for and determining the carrier frequency of the RF control signal; and

selecting ~~an~~ at least one RF frequency from a pre-stored list of frequencies based on the determined manufacturer.
